

For running .py file copy all the files and subfolders that I'm sharing with you into your working directory then open .py file with any of the python compatible text editors. Make sure that you have installed python in your machine.

How I approached the problem:

First of all, I have gone through the folder that you have given me, then I got a basic idea what to do. I do have basic understanding of ML libraries like pandas, NumPy and sikitlearn and my moto while approaching the problem is any how I have to use my previous knowledge. So, I started off with reading the excel file with pandas which made me flexible to iterate through all the URLs. I did a project on web scrapping already. So, I completed that part with ease and wrote the text into files. The major constrain is I don't have any basic idea about text analysis, so I have gone through the files that you have sent. I got basic idea hoe to move further ahead and went to YouTube to learn basic things of text analysis. But I got stuck in many places, to get out of it I used online resources.

THANK YOU SIR, FOR GIVING ME OPPURTUNITY BECAUSE OF YOU I WAS ABLE TO REVISE ALL MY PYTHON SKILLS
